Questions regarding the Summary of Pesticide Use Report Data or information regarding the availability and cost of the computerized database should be directed to: Department of Pesticide Regulation, Pest Management and Licensing Branch, P.O. Box 4015, Sacramento, California 95812-4015. Telephone (916) 324-4100.

## Order Form

To continue to make the *Summary of Pesticide Use Report Data* available, it is necessary to charge for the costs of reproduction and mailing. The reports can also be downloaded free of charge from the Department's web site ([www.cdpr.ca.gov](http://www.cdpr.ca.gov)).

The 1993 - 1999 *Summary of Pesticide Use Report Data* indexed by chemical or commodity reports are available on floppy disk in ASCII format (**discontinued in 2001**). Also available is the Annual Pesticide Use Report Data (the complete database of reported pesticide applications) on CD ROM. The 1990 - 2000 reports are available in text (fixed width), dBase, and GIS formats. Beginning with 2001 report, only the text version (comma delimited format) is available.

The *Summary of Pesticide Use Report Data* is available in two formats. One report is indexed by chemical and lists the amount of each pesticide used, the commodity on which it was used, the number of applications, and the acres/units treated. The second report is indexed by commodity and lists the chemicals used, the number of applications, amount of pesticides used, and the acres/units treated.

Please use this form to order reports and enclose payment to the address below.

### California Pesticide Use Report Order Form

Item	Report	Quantity	Amount	Total
603	Summary Report by Commodity (year)_____ (printed)		\$10.00	
604	Summary Report by Chemical (year)_____ (printed)		\$10.00	
605	Summary Report by Commodity <b>or</b> Chemical (circle one) (year)_____ (disk) ( <b>discontinued in 2001</b> )		\$ 2.50	
608	Annual Pesticide Use Report Data (CD ROM) (year)_____ (available from 1990) (various formats)		\$12.00

## **I. INTRODUCTION**

### **DEVELOPMENT AND IMPLEMENTATION OF THE PESTICIDE USE REPORTING SYSTEM**

This 2001 *Summary of Pesticide Use Report Data* includes agricultural applications and other selected uses reported in California. This summary data represents a small fraction of the information gathered under full use reporting. DPR uses the data to help estimate dietary risk and to ensure compliance with clean air laws and ground water protection regulations. Site-specific use report data, combined with geographic data on endangered species habitats, also helps county agricultural commissioners resolve potential pesticide use conflicts. Detailed, individual pesticide use report data may be obtained from DPR for in-depth, analytical purposes.

To provide public access to the data as soon as possible, the Department of Pesticide Regulation (DPR) is releasing the 2001 data before the majority of error corrections have been completed. Values have been substituted for some errors (see 'Outliers'), but data correction is ongoing. The data will undergo more extensive correcting.

Under full use reporting, which began in 1990, California became the first state to require reporting of all agricultural pesticide use, including amounts applied and types of crops or places (e.g., structures, roadsides) treated. Commercial applications—including structural fumigation, pest control, and turf applications—must also be reported. The main exceptions to full use reporting are home and garden applications, and most industrial and institutional uses. Pesticide use reporting is explained in more detail below.

To enhance accuracy of the data, DPR contracts with agricultural commissioners in 56 of the state's 58 counties for the electronic submittal of their pesticide use data to DPR. This accounts for more than 99 percent of the total reported pesticide usage in the State.

To further improve the accuracy and timeliness of pesticide use data, DPR initiated the California Electronic Data Transfer System (CEDTS) in 1994. This system allows growers and pest control operators to electronically transfer application data to the agricultural commissioners' offices. By the close of 1998, 36 counties were capable of receiving data through the CEDTS program. Although response to CEDTS from pesticide users was favorable, adoption of the reporting system was slow. Many growers and pest control operators lack the time and expertise to write the software that pulls together the necessary pieces of information into a single pesticide use application database that meets DPR's standardized data requirements. In response, in 1999, private software providers and others began introducing systems that allow use reporting via Internet Web sites. In addition, new programs are being developed to allow nonagricultural users of pesticides to file electronic reports.

### **TYPES OF PESTICIDE APPLICATIONS REPORTED**

Partial reporting of agricultural pesticide use has been in place in California since at least the 1950s. Beginning in 1970, anyone who used restricted materials was required to file a pesticide use report with the county agricultural commissioner. The criteria established to designate a pesticide as a restricted material include hazard to public health, farm workers, domestic animals, honeybees, the environment, wildlife, or other crops. Restricted materials, with certain exceptions, may be possessed or used only by, or under the supervision of, licensed or certified persons and only in accordance with an annual permit issued by the county agricultural commissioner.

In addition, the State required commercial pest control operators (those in the business of applying pesticides, such as agricultural applicators, structural fumigators, and professional gardeners) to report all pesticides used, whether restricted or nonrestricted. These reports included information about the pesticide applied, when and where the application was made, and the crop involved if the application was in agriculture. The reports were entered into a computerized database and summarized by chemical and crop in annual reports.

With implementation of full use reporting in 1990, the following pesticide uses are required to be reported to the commissioner, who, in turn, reports the data to DPR:

- For the production of any agricultural commodity, except livestock.
- For the treatment of postharvest agricultural commodities.
- For landscape maintenance in parks, golf courses, and cemeteries.
- For roadside and railroad rights-of-way.
- For poultry and fish production.
- Any application of a restricted material.
- Any application of a pesticide with the potential to pollute ground water (listed in the California Code of Regulations, Title 3, Division 6, Chapter 4, Subchapter 1, Article 1, Section 6800 [b]) when used outdoors in industrial and institutional settings.
- Any application by a licensed pest control operator.

The primary exceptions to the use reporting requirements are home and garden use and most industrial and institutional uses.

### **HOW PESTICIDE DATA ARE USED**

DPR undertook the expansion of use reporting primarily in response to concerns of many individuals and groups, including government officials, scientists, farmers, legislators, and public interest groups. It was generally acknowledged that the system for estimating dietary exposure to pesticide residues did not provide sufficient data on which to make realistic assessments; this often resulted in overestimates of risk. Farm worker representatives were also demanding more information to determine exposure and potential risk to those who handle pesticides or who work in treated fields.

There are several key areas in which data generated by full use reporting are proving beneficial:

#### **Risk Assessment**

Without information on actual pesticide use, regulatory agencies conducting risk assessment assume all planted crop acreage is treated with many pesticides, though most crops are treated with just a few chemicals. If the assumptions used by regulatory agencies are incorrect, regulators could make judgments on pesticide risks that are too cautious by several orders of magnitude, reducing the credibility of risk management decisions. The use report data, on the other hand, provides actual use data so DPR can better assess risk and make more realistic risk management decisions.

After the passage of the federal Food Quality Protection Act (FQPA) in 1996, complete pesticide use data became even more important to commodity groups in California and to the U.S. Environmental Protection Agency (U.S. EPA). FQPA contains a new food safety standard against which all pesticide tolerances must be measured. The increased interest in the state's pesticide use data, especially for calculating percent crop treated, came at a time when DPR was increasing the efficiency with which it produced its annual report. DPR was able to provide up-to-date use data and

summaries to commodity groups, University of California specialists, U.S. EPA programs, and other interested parties as they developed the necessary information for the reassessment of existing tolerances.

### **Worker Health and Safety**

Under the reporting regulations, pest control operators must give farmers a written notice after every pesticide application that includes the date and time the application was completed, and the reentry and preharvest intervals (respectively, the intervals between the time a pesticide is applied and when workers may enter the field, and the time of application and when a commodity can be harvested). This notice gives the farmer accurate information to help keep workers from entering fields prematurely, and also lets the farmer know the earliest date a commodity can be harvested.

DPR's Worker Health and Safety Branch also uses the data for worker exposure assessment as part of developing an overall risk characterization document. Use data helps scientists estimate typical applications and how often pesticides are used.

### **Public Health**

The expanded reporting system provides DPR and the State Department of Health Services with complete pesticide use data for evaluating possible human illness clusters in epidemiological studies.

### **Endangered Species**

DPR is working with the commissioners to combine site-specific use report data with geographic information system-based data on locations of endangered species. The resulting database helps commissioners resolve potential conflicts over pesticide use when endangered species may occur. DPR and the commissioners can also examine patterns of pesticide use near habitats to determine the potential impact of proposed use limitations. With location-specific data on pesticide use, restrictions on use can be better designed to protect endangered species while still allowing necessary pest control.

### **Water Quality**

In meeting the requirements of the Pesticide Contamination Prevention Act of 1985, site-specific records help track pesticide use in areas known to be susceptible to ground water contamination. Determinations can also be made from the records on whether a contaminated well is physically associated with agricultural practices. These records also provide data to help researchers determine why certain soil types are more prone to ground water contamination.

Since 1983, DPR has had a program to work with the rice industry and the Central Valley Regional Water Quality Control Board to reduce contamination of surface water by rice pesticides. Using PUR data to help in pinpointing specific agricultural practices, more precise alternative use recommendations can be made to assure protection of surface water.

### **Air Quality**

Many pesticide products contain volatile organic compounds (VOCs) that contribute to the formation of smog. DPR worked with the state Air Resources Board to put together a State Implementation Plan under the federal Clean Air Act to reduce emissions of all sources of VOCs, including pesticides, in nonattainment areas of the state. DPR's contribution to the plan included

accurate data on the amount of VOCs contained in pesticides and the ability to inventory the use of those pesticides through pesticide use reporting.

### **Pest Management**

The Department uses the PUR database to understand patterns and changes in pest management practices. This information can be used to determine possible alternatives to pesticides that are subject to regulatory actions and to help determine possible impacts of different regulatory actions on pest management.

The PUR is used to help meet the needs of FQPA, which requires pesticide use information for determining the appropriateness of pesticide residue tolerances. As part of this process many commodity groups have created crop profiles, which include information on the pest management practices and available options, both chemical and nonchemical. Pesticide use data is critical to developing these lists of practices and options.

DPR manages several grant programs, pending availability of funding, to support projects to develop, implement, and demonstrate reduced-risk pest management strategies. (Due to a statewide budget shortfall, no money is available to fund new projects for fiscal year 2002/2003.) One of these programs is the Pest Management Alliance Grants. This program provides grant money to growers, commodity boards, farm advisors, urban site representatives, researchers, and government to identify critical pest management needs, environmental or human exposure issues resulting from pesticide use, and to develop a program to solve the critical problems. To help the groups in their evaluations of current pest management practices, DPR provides data on use of all pesticides on the Alliance crop or site. DPR and other funding agencies can also use the PUR to help evaluate the effectiveness of the programs they have funded.

DPR has published general analyses of statewide pesticide use patterns and trends. The first analysis covered the years 1991 to 1995, and the second more detailed analysis covered 1991 to 1996. These analyses identified high-use pesticides, the crops to which those pesticides were applied, trends in use, and the pesticides most responsible for changes in use. In addition, since 1997, the annual reports Summary of Pesticide Use Report Data include summary trends of pesticides in several different categories such as carcinogens, reproductive toxins, and ground water contaminants.

### **Processor and Retailer Requirements**

Food processors, produce packers, and retailers often require farmers to submit a complete history of pesticide use on crops. DPR's use report form often satisfies this requirement.

## II. COMMENTS AND CLARIFICATIONS OF DATA

The following comments and points should be taken into consideration when analyzing data contained in this report:

### TERMINOLOGY

The following terminology is used in this report:

*Number of agricultural applications* – Number of applications of pesticide product made to production agriculture. More detailed information is given below under "Number of Applications."

*Pounds applied* – Number of pounds of an active ingredient.

*Unit type* – The amount listed in this column is one of the following:

A = Acreage

C = Cubic feet (of commodity treated)

K = Thousand cubic feet (of commodity treated)

P = Pounds (of commodity treated)

S = Square feet

T = Tons (of commodity treated)

U = Miscellaneous units (e.g., number of tractors, trees, bins, etc.)

### COMMODITY CODES

DPR's pesticide product label database is used to cross-check data entries to determine if the product reported used is registered on the reported commodity. The DPR label database uses a crop coding system based on crop names used by the U.S. EPA to prepare official label language. However, this system caused some problems until DPR modified it in the early 1990s to account for U.S. EPA's grouping of certain crops under generic names. Problems occurred when the label language in the database called a crop by one name, and the use report used another. For example, a grower may have reported a pesticide use on "almonds," but the actual label on the pesticide product--coded into the database--stated the pesticide was to be used on "nuts." To eliminate records being rejected as "errors" because the specific commodity listed on the use report is not on the label, DPR modified the database. To designate a commodity not specifically listed on the label as a correct use, a qualifier code is appended to the commodity code in the label database. In our example above, a qualifier code would be attached to the "almond" code when nuts are only listed on the label. This system greatly reduces the number of rejections.

Plants and commodities grown in greenhouse and nursery operations represented a challenge in use reporting because of their diversity. Six commodity groupings were suggested by industry in 1990 and incorporate terminology that are generally known and accepted. The six use reporting categories are: greenhouse-grown cut flowers or greens; outdoor-grown cut flowers or greens; greenhouse-grown plants in containers; outdoor container/field-grown plants; greenhouse-grown transplants/propagative material; and outdoor-grown transplants/propagative material.

Tomatoes and grapes were also separated into two categories because of public and processor interest in differentiating pesticide use. Tomatoes are assigned two codes to differentiate between fresh market and processing categories. One code was assigned to table grapes, which includes grapes grown for fresh market, raisins, canning or juicing. A second code was assigned to wine grapes.

## **UNREGISTERED USE**

The report contains entries that reflect the use of a pesticide on a commodity for which the pesticide is not currently registered. This sometimes occurs because the original use report was in error, that is, either the pesticide or the commodity was inaccurately reported. DPR's computer program checks that the commodity is listed on the label, but nonetheless such errors appear in the PUR, possibly because of errors in the label database. Also, the computer program does not check whether the pesticide product was registered at the time of application. For example, parathion (ethyl parathion) is shown reported on crops after most uses were suspended in 1992. (These records continue to be researched and corrected.) DPR is continuing to implement methods to identify and reduce these types of reporting errors in future reports. Other instances may occur because by law, growers are sometimes allowed to use stock they have on hand of a pesticide product that has been withdrawn from the market by the manufacturer or suspended or canceled by regulatory authorities.

Other reporting "errors" may occur when a pesticide is applied directly to a site to control a particular pest, but is not applied directly to the crop in the field. A grower may use an herbicide to treat weeds on the edge of a field, a fumigant on bare soil prior to planting, or a rodenticide to treat rodent burrows. For example, reporting the use of the herbicide glyphosate on tomatoes – when it was actually applied to bare soil prior to planting the tomatoes – could be perceived to be an error. Although technically incorrect, recording the data as if the application were made directly to the commodity provides valuable crop usage information for DPR's regulatory program.

## **ADJUVANTS**

Data on spray adjuvants (including emulsifiers, wetting agents, foam suppressants, and other efficacy enhancers), not reported prior to full use reporting, are now included. Examples of these types of chemicals include the "alkyls" and some petroleum distillates. (Adjuvants are exempt from federal registration requirements, but must be registered as pesticides in California.)

## **ZERO POUNDS APPLIED**

There are a few entries in this report in which the total pounds applied for certain active ingredients are displayed as zero. This is because the chemical (active ingredient) made up a very small percentage of the formulated product that was used. When these products are applied in extremely low quantities, the resulting value of the active ingredient is too low to register an amount.

## **ACRES TREATED**

The summary information in this annual report cannot be used to determine the total number of acres of a crop to which pesticides were applied during the year. Sometimes the product used contains more than one active ingredient. (In any pesticide product, the active ingredient is the component which kills, or otherwise controls, target pests. A pesticide product is made up of one or more active ingredients, as well as one or more inert ingredients.) For example, if a 20-acre field is treated with a product that contains three different pesticide active ingredients, a use report is filed by the farmer correctly recording the application of a single pesticide product to 20 acres. However, in the summary tables, the three different active ingredients will each have recorded 20 acres treated. Adding these values results in a total of 60 acres as being treated instead of the 20 acres actually treated. A similar problem occurs when the same field is treated more than once in the year with the same active ingredient.

## **NUMBER OF APPLICATIONS**

The values for number of applications include only production agricultural applications. Applicators are required to submit one of two basic types of use reports, a production agricultural report or a monthly summary report. The production agricultural report must include information for each application. The monthly summary report, for all uses other than production agriculture, includes only monthly totals for all applications of pesticide product, site or commodity, and applicator. The total number of applications in the monthly summary reports are not consistently given so they are no longer included in the totals. In the annual PUR reports before 1997, each monthly summary report was counted as one application.

Also, in the annual summary report by commodity, the total number of applications given for each commodity may not equal the sum of all applications of each active ingredient on that commodity. As explained above, some pesticide products contain more than one active ingredient. If the number of applications were summed for each active ingredient in such a product, the total number of applications would be more than one, even though only one application of the product was made. The totals given in the annual summary report take into account such multiple active ingredient products and counts each as only one application.

## **OUTLIERS**

In calculating the total pounds of pesticides used in these tables, DPR excluded values for rates of use which were so large they were probably in error. Errors occur, for example, when those reporting pesticide use shift decimal points during data entry. DPR specialists spent more than a year developing, testing, and implementing software to detect probable errors (outliers). Pesticide rates were considered outliers if (1) they were higher than 200 pounds of active ingredient per acre (or greater than 1,000 pounds per acre for fumigants); (2) they were 50 times larger than the median rate for all uses with the same pesticide product, crop treated, unit treated, and record type (that is, production agricultural or all other use); or (3) they were higher than a value determined by a neural network procedure that approximates what a group of 12 scientists believed were obvious outliers. Although these criteria removed less than one percent of the rate values in the PUR, some rates were so large that if included in the sums, they would have significantly affected total pounds applied of some pesticides. (The outliers are excluded from the total pounds in the summary reports but remain in the database.)

For the years 1991 to 1998, we determined whether or not a use rate was an outlier based on the distribution of rates for all applications on each crop and pesticide during the year of its application. For the 1999 PUR we determined outliers in two stages. In the first stage, outliers were identified as data came to DPR from the counties during the year but based on the distribution of rates from the previous year. This procedure allowed us to include outliers in the error reports sent back to the counties. In the second stage, the outlier program was run after all 1999 data were received using the distribution of rates for 1999. This procedure found additional outliers for new products and new uses. For the 2001 PUR, the data was processed in the same manner.

Beginning with the 1999 PUR data, values have been substituted where outliers were identified in the first phase. Nulls were substituted in numeric fields identified as outliers, and “???” were substituted in character fields identified as outliers. A median rate value for use on a commodity/product combination was substituted where a high rate per acre was the error. In addition, “Unknown” was substituted where the reported site code was invalid.

### **III. DATA SUMMARY**

This report is a summary of data submitted to DPR. Total pounds may change slightly due to ongoing error correction. The revised numbers will more accurately reflect the total pounds applied.

#### **PESTICIDE USE IN CALIFORNIA**

In 2001, there were 151,124,188 pounds of pesticide active ingredients reported used in California. (Not all of Kern County PUR data was available at the time of publication.) Annual use has varied from year to year since full use reporting was implemented in 1990. Reported pesticide use was 188 million pounds in 2000, 203 million pounds in 1999, 214 million pounds in 1998, 205 million pounds in 1997, 198 million pounds in 1996.

Such variances are and will continue to be a normal occurrence. These fluctuations can be attributed to a variety of factors, including changes in planted acreage, crop plantings, pest pressures, and weather conditions. For example, extremely heavy rains result in excessive weeds, thus more pesticides may be used; drought conditions may result in fewer planted acres, thus less pesticide may be used.

As in previous years, the greatest pesticide use occurred in California's San Joaquin Valley (Table 1). Five counties in this region had the highest use: Fresno, Kern, Tulare, San Joaquin, and Madera.

Table 2 breaks down the pounds of pesticide use by general use categories: production agriculture, post-harvest commodity fumigation, structural pest control, landscape maintenance, and all others.

#### **PESTICIDE SALES IN CALIFORNIA**

Reported pesticide applications are only a portion of the pesticides sold each year. Typically, about two-thirds of the pesticide active ingredients sold in a given year are not subject to use reporting. Examples of non-reported active ingredients are chlorine (used primarily for municipal water treatment) and home-use pesticide products.

Sales data are not yet available for 2001. There were approximately 601 million pounds of pesticide active ingredients sold in California in 2000; 705.9 million pounds in 1999; 625.9 million pounds in 1998; 653.9 million pounds in 1997; 699.5 million pounds in 1996; 543.1 million pounds in 1995; and 627.9 million pounds in 1994.

In addition, it should be noted that the pounds of pesticides used and the number of applications are not necessarily accurate indicators of the extent of pesticide use or, conversely, the extent of use of reduced-risk pest management methods. For example, farmers may make a number of small-scale "spot" applications targeted at problem areas rather than one treatment of a large area. They may replace a more toxic pesticide used at one pound per acre with a less hazardous compound that must be applied at several pounds per acre. Either of these scenarios could increase the number of applications and amount of pounds used without indicating an increased reliance on pesticides.

**Table 1.** Total pounds of pesticide active ingredients reported in each county during 2000 and 2001 and its rank among all 58 counties.

\* This category includes pesticide applications reported in the following general categories: pest control on rights-of-way; public health which includes mosquito abatement work; vertebrate pest control; fumigation of nonfood and nonfeed materials such as lumber, furniture, etc.; pesticide used in research; and regulatory pest control used in ongoing control and/eradication of pest infestations.

\*\* Not all of Kern County PUR data was available at the time of publication. The statewide 2001 PUR database will be amended to include the Kern County data.

#### IV. TRENDS IN USE IN CERTAIN PESTICIDE CATEGORIES

Reported pesticide use in California in 2001 totaled 151 million pounds, a decline of 37 million pounds from 2000 and the lowest reported pounds applied statewide since full use reporting started in 1990. Since DPR has not received all of Kern County data, the total reported use is greater than 151 million pounds but probably not by more than 5 million pounds based on a statistical analysis of pesticide use in Kern County from the last 5 years.

Production agriculture, the major category of use subject to reporting requirements, accounted for most of the overall decrease in use. Applications for production agriculture dropped by 35 million pounds.

Major crops that showed an overall decline in pesticide pounds applied from 2000 to 2001 included raisin and table grapes (7.2 million pounds), wine grapes (4.8 million pounds), sugar beets (down 3.2 million pounds), processing tomatoes (3.0 million pounds), oranges (2.3 million pounds), carrots (1.6 million pounds), and almonds (down 1.5 million pounds). Major crops and commodities with increased pounds applied included lumber (up 0.3 million pounds), bermudagrass (0.2 million pounds), and strawberries (0.1 million pounds).

The active ingredients with the largest decline in use by pounds were sulfur, petroleum oils, and methyl bromide. Sulfur use declined from 2000 to 2001 by 16 million pounds (25%) yet still remained the most highly used pesticide in 2001, both in pounds applied and acres treated. By pounds, sulfur accounted for 31% of all reported pesticide use. Sulfur is a natural fungicide favored by both conventional and organic farmers. Petroleum oil use declined by 5 million pounds (14%), and methyl bromide use declined by 4 million pounds (39%).

DPR data analyses have shown that pesticide use varies from year to year depending upon pest problems, weather, acreage and types of crops planted, economics, and other factors. Sulfur use, as well as other pesticide use, declined on table and raisin grapes in 2001 possibly because of low commodity prices. Low commodity prices for almond, cotton, rice, and leaf lettuce may have also contributed to decreased use of many pesticides. Growers will try to reduce expenses (such as pesticide applications) if they expect lower prices for their crops. In addition, in 2001, disease and weed pressure were low in most crops resulting in less fungicide and herbicide use. Although acreage decreased for some crops, this decrease was too small to explain most of the decrease in pesticide use. Decreased methyl bromide use can be attributed to fewer new plantings of grapes and some other crops, increased cost, and additional regulatory restrictions placed on its use.

Pesticide use is reported as the number of pounds of active ingredient and the total number of acres treated. The data for pounds include both agricultural and non-agricultural applications; the data for acres treated are primarily agricultural applications. The number of acres treated means the cumulative number of acres treated; the acres treated in each application are summed even when the same field is sprayed more than once in a year. (For example, if one acre is treated three times in a season with an individual active ingredient, it is counted as three acres treated in the tables and graphs in Section IV of this report.)

Because the 2001 data does not include many reports from Kern County and errors have not been completely identified and corrected, the values should be viewed with caution. However, based on

this data, use declined in nearly all pesticide categories in both pounds of active ingredient applied and cumulative acres treated. Some of the major statistical changes from 2000 to 2001 include:

- Use of insecticide organophosphate and carbamate chemicals, which includes compounds of high regulatory concern, declined by 2.4 million pounds (21%) from 2000 to 2001. Cumulative acres treated with these pesticides declined by 1.5 million acres (18%).
- Chemicals classified as carcinogens declined in overall pounds applied (down 3.1 million pounds or 13%) and in cumulative acres treated (down 3.2 million acres or 47%).
- Chemicals classified as reproductive toxins also showed an overall decline in pounds applied (down 6.0 million pounds or 23%) and cumulative acres treated (down 1.3 million acres or 33%).
- Chemicals categorized as toxic air contaminants, another regulatory concern, decreased by 6.1 million pounds applied (28%). Cumulative acres treated decreased by about 1.5 million acres (34%).
- Chemicals categorized as ground water contaminants decreased by about 553,000 pounds applied (18%). Cumulative acres treated decreased by about 335,000 acres (15%).
- Reduced-risk pesticides decreased by 40,000 pounds applied (7%), but cumulative acres treated increased by 134,000 acres (5%). However, more reduced-risk pesticides had increased use than decreased use. Biopesticides decreased by 66,000 pounds (19%) and decreased by 183,000 cumulative acres treated (17%) from 2000 to 2001.

Since 1994, the reported pounds of pesticides applied has fluctuated from year to year with no general increasing or decreasing trend. An increase or decrease in use from one year to the next or in the span of a few years does not necessarily indicate a general trend in use; it simply may reflect normal variations. Short periods of time (three to five years) may suggest trends, such as the increased pesticide use from 1994 to 1998 or the decreased use from 1998 to 2001. However, the trend from 1994 to 2001 was not statistically decreasing or increasing.

To improve data quality when calculating the total pounds of pesticides, DPR excluded values that were so large they were probably in error. The procedure to exclude probable errors involved the development of complex error-checking algorithms, a data improvement process that is ongoing.

Over-reporting errors have a much greater impact on the numerical accuracy of the database than under-reporting errors. For example, if a field is treated with 100 pounds of a pesticide active ingredient and the application is erroneously recorded as 100,000 pounds (a decimal point shift of three places to the right), an error of 99,900 pounds is introduced into the database. If the same degree of error is made in shifting the decimal point to the left, the application is recorded as 0.1 pound, and an error of 99.9 pounds is entered into the database.

To provide an overview, pesticide use is summarized for eight different categories from 1993 to 2000 (Tables 3–10 and Figures 1–8). These categories classify pesticides according to certain characteristics such as reproductive toxins, carcinogens, or reduced-risk characteristics.

The statistical summaries detailed in these categories are not intended to serve as indicators of pesticide risks to the public or the environment. Rather, the data supports DPR regulatory functions to enhance public safety and environmental protection. (See “How Pesticide Data are Used” on page iv.) The different pesticide categories, described more fully, are:

- 1) Pesticides listed on the State's Proposition 65 list of chemicals "known to cause reproductive toxicity."
- 2) Pesticides listed by U.S. EPA as B2 carcinogens or on the State's Proposition 65 list of chemicals "known to cause cancer."
- 3) Pesticides that are cholinesterase inhibitors, that is, organophosphate and carbamate chemicals.
- 4) Pesticides on DPR's groundwater protection list (California Code of Regulations, Title 3, Division 6, Chapter 4, Subchapter 1, Article 1, Section 6800[a]) and norflurazon, which DPR is recommending be listed as a restricted material.
- 5) Pesticides from DPR's toxic air contaminants list (California Code of Regulations, Title 3, Division 6, Chapter 4, Subchapter 1, Article 1, Section 6860).
- 6) Oil pesticides, which may include some chemicals on the State's Proposition 65 list of chemicals "known to cause cancer" but which also serve as alternatives to high-toxicity pesticides.
- 7) Active ingredients contained in pesticide products that have been given reduced-risk status by U.S. EPA.
- 8) Biopesticides, which include microorganisms and naturally occurring compounds, or compounds essentially identical to naturally occurring compounds that are not toxic to the target pest (such as pheromones).

**USE TRENDS OF PESTICIDES ON THE STATE'S PROPOSITION 65 LIST OF CHEMICALS THAT ARE "KNOWN TO CAUSE REPRODUCTIVE TOXICITY".**

**Table 3A.** The reported **pounds** of pesticides used which are on the State's Proposition 65 list of chemicals that are "known to cause reproductive toxicity". Use includes both agricultural and reportable non-agricultural applications.

**Figure 1.** Use trends of pesticides that are on the State’s Proposition 65 list of chemicals that are “known to cause reproductive toxicity”. Reported pounds of active ingredient (AI) applied includes both agricultural and non-agricultural applications. The reported cumulative acres treated includes primarily agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

**Use Trends of Pesticides listed by U.S. EPA as Carcinogens or by the state as "known to cause cancer".**

**Table 4A.** The reported **pounds** of pesticides used that are listed by U.S. EPA as B2 carcinogens or that are on the State's Proposition 65 list of chemicals "known to cause cancer". Use includes both agricultural and reportable non-agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

**Table 4B.** The reported **cumulative acres treated** with pesticides listed by U.S. EPA as B2 carcinogens or on the State’s Proposition 65 list of chemicals “known to cause cancer”. Use includes primarily agricultural applications. The grand total for acres treated is less than the sum of acres treated for all active ingredients because some products contain more than one active ingredient. Data are from the Department of Pesticide Regulation's Pesticide Use.

**Figure 3.** Use trends of cholinesterase-inhibiting pesticides, which includes pesticides with organophosphate and carbamate active ingredients. Reported pounds of active ingredient (AI) applied includes both agricultural and reportable non-agricultural applications. The reported cumulative acres treated includes primarily agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

## USE TRENDS OF PESTICIDES ON DPR'S GROUNDWATER PROTECTION LIST

**Table 6A.** The reported **pounds** of pesticides on DPR's groundwater protection list. These pesticides are the currently registered active ingredients listed in the California Code of Regulations, Title 3, Division 6, Chapter 4, Subchapter 1, Article 1, Section 6800(a). Use includes both agricultural and reportable non-agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

These pesticides are the currently registered active ingredients listed in the California Code of Regulations, Title 3, Division 6, Chapter 4, Subchapter 1, Article 1, Section 6800(a). Use includes primarily agricultural applications. The grand total for acres treated is less than the sum of acres treated for all active ingredients because some products contain more than one active ingredient. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

**Figure 4.** Use trends of pesticides on DPR's groundwater protection list. These pesticides are the currently registered active ingredients listed in the California Code of Regulations, Title 3, Division 6, Chapter 4, Subchapter 1, Article 1, Section 6800(a). Reported pounds of active ingredient (AI) applied includes both agricultural and reportable non-agricultural applications. The reported cumulative acres treated includes primarily agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

## USE TRENDS OF PESTICIDES ON DPR'S TOXIC AIR CONTAMINANTS LIST

**Table 7A.** The reported **pounds** of pesticides on DPR's toxic air contaminants list applied in California. These pesticides are the currently registered active ingredients listed in the California Code of Regulations, Title 3, Division 6, Chapter 4, Subchapter 1, Article 1, Section 6860. Use includes both agricultural and reportable non-agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

**Figure 5.** Use trends of pesticides on DPR's toxic air contaminants list. These pesticides are the currently registered active ingredients listed in the California Code of Regulations, Title 3, Division 6, Chapter 4, Subchapter 1, Article 1, Section 6860. Reported pounds of active ingredient (AI) applied includes both agricultural and reportable non-agricultural applications. The reported cumulative acres treated includes primarily agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

## Use Trends of Oil Pesticides

**Table 8A.** The reported **pounds** of oil pesticides. As a broad group, oil pesticides and other petroleum distillates are on U.S. EPA's list of B2 carcinogens or the State's Proposition 65 list of chemicals "known to cause cancer." However, these classifications do not distinguish among oil pesticides that may not qualify as carcinogenic due to their degree of refinement. Many such oil pesticides also serve as alternatives to high-toxicity chemicals. For this reason, oil pesticide data was classified separately in this report. Use includes both agricultural and reportable non-agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

**Figure 6.** Use trends of oil pesticides. As a broad group, oil pesticides and other petroleum distillates are on U.S. EPA’s list of B2 carcinogens or the State’s Proposition 65 list of chemicals “known to cause cancer.” However, these classifications do not distinguish among oil pesticides that may not qualify as carcinogenic due to their degree of refinement. Many such oil pesticides also serve as alternatives to high-toxicity chemicals. For this reason, oil pesticide data was classified separately in this report. Reported pounds of active ingredient (AI) applied includes both agricultural and reportable non-agricultural applications. The reported cumulative acres treated includes primarily agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

## Use Trends of Reduced-Risk Pesticides

**Table 9A.** The reported **pounds** of reduced-risk pesticides applied in California. These active ingredients are contained in pesticide products that have been given reduced-risk status by U.S. EPA. Use includes both agricultural and non-agricultural applications. Zero values in early years likely indicate the pesticide was not yet registered for use. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

**Figure 7.** Use trends of reduced-risk pesticides. These active ingredients are contained in pesticide products that have been given reduced-risk status by U.S. EPA. Reported pounds of active ingredient (AI) applied includes both agricultural and reportable non-agricultural applications. The reported cumulative acres treated includes primarily agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

## USE TRENDS OF BIOPESTICIDES.

**Table 10A.** The reported **pounds** of biopesticides applied in California. Biopesticides include microorganisms and naturally occurring compounds, or compounds essentially identical to naturally occurring compounds that are not toxic to the target pest (such as pheromones). Use includes both agricultural and non-agricultural applications. Zero values in early years likely indicate the pesticide was not yet registered for use. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

**Table 10B.** The reported **cumulative acres treated** in California with each biopesticide. Biopesticides includes microorganisms and naturally occurring compounds, or compounds essentially identical to naturally occurring compounds that are not toxic to the target pest (such as pheromones). Use includes primarily agricultural applications. The grand total for acres treated is less than the sum of acres for all active ingredients because some products contain more than one active ingredient. Zero values in early years likely indicate the pesticide was not yet registered for use. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

**Figure 8.** Use trends of biopesticides. Biopesticides include microorganisms and naturally occurring compounds, or compounds essentially identical to naturally occurring compounds that are not toxic to the target pest (such as pheromones). Reported pounds of active ingredient (AI) applied includes both agricultural and reportable non-agricultural applications. The reported cumulative acres treated includes primarily agricultural applications. Data are from the Department of Pesticide Regulation's Pesticide Use Reports.

## V. TRENDS IN PESTICIDE USE IN CERTAIN COMMODITIES

This summary describes possible reasons for changes in pesticide use from 2000 to 2001 for the following commodities: (1) grapes (wine), (2) grapes (table and raisin), (3) almonds, (4) cotton, (5) strawberry, (6) tomato (processing), (7) rice, (8) peaches and nectarines, (9) head lettuce, and (10) leaf lettuce. These ten commodities were chosen because they had the greatest pesticide use or were of particular interest to DPR.

Information used to develop this section was drawn from phone interviews with pest control advisors, University of California Cooperative Extension farm advisors and specialists, researchers, commodity association representatives, and growers. The information collected was analyzed by DPR staff using their extensive knowledge of pesticides, California agriculture, and pest management practices to draw conclusions about possible reasons for changes in pesticide use. Thus, these explanations are based on anecdotal information, not rigorous statistical analyses.

Reported pesticide use in California in 2001 totaled 151 million pounds, a decline of 37 million pounds from 2000 and the lowest reported pounds applied statewide since full use reporting started in 1990. The active ingredients with the largest decline in use by pounds were sulfur, petroleum oils, and methyl bromide. Sulfur use declined from 2000 to 2001 by 16 million pounds (25%) yet still remained the most highly used pesticide in 2001, both in pounds applied and acres treated. By pounds, sulfur accounted for 31% of all reported pesticide use. Sulfur is a natural fungicide favored by both conventional and organic farmers. Petroleum oil use declined by 5 million pounds (14%), and methyl bromide use declined by 4 million pounds (39%).

DPR data analyses have shown that pesticide use varies from year to year depending upon pest problems, weather, acreage and types of crops planted, economics, and other factors. Sulfur use, as well as other pesticide use, declined on table and raisin grapes in 2001 possibly because of low commodity prices. Low commodity prices for almond, cotton, rice, and lettuce may have also contributed to decreased use of many pesticides. Growers will try to reduce expenses (such as pesticide applications) if they expect lower prices for their crops. In addition, in 2001, disease and weed pressure were low in most crops resulting in less fungicide and herbicide use. Although acreage decreased for some crops, this decrease was too small to explain most of the decrease in pesticide use. Decreased methyl bromide use can be attributed to fewer new plantings of grapes and some other crops, increased cost, and additional regulatory restrictions placed on its use.

Not all of Kern County PUR data was available at the time of publication. When we receive Kern County data, we will add carrots and oranges to our summary. In 2000, 44% of the pounds reported on carrots and 24% of the use on oranges were from Kern. Based on the data currently received from Kern, only 30% of the use on carrots and 17% of the use on oranges are from Kern County suggesting that many records of use on carrots and oranges have not yet been received.

Use is given by pounds of active ingredient applied and by acres treated. Acres treated means the cumulative number of acres treated; the acres treated in each application are summed even when the same field is sprayed more than once in a year. (For example, if one acre is treated three times in a season with an individual active ingredient, it is counted as three acres treated).

## **Grapes**

**Wine grapes:** Total pounds of active ingredient (AI) on wine grapes decreased by 4.8 million pounds from 2000 to 2001 (from 27.7 million pounds to 22.8 million pounds, an 18% decrease). The acres treated decreased by 0.6 million acres (7.1 million to 6.5 million acres, an 8% decrease). Wine grape acreage showed a small increase of 2,000 acres from 2000 to 2001 (from 568,000 acres to 570,000 acres, a 0.4% increase) (CASS 2002b). From 2000 to 2001, the price per ton increased from \$628 to \$679 per ton for red wines and decreased from \$500 to \$491 per ton for white wines (CASS 2002c).

About 83% of the decreased pesticide use was due to less sulfur (from 23.7 million pounds to 19.7 million pounds, a 17% decrease). In addition to sulfur, oryzalin, methyl bromide, calcium hydroxide, copper oxychloride sulfate, and fenamiphos showed major decreases in use. Fungicide use (such as sulfur, copper oxychloride sulfate, myclobutanil, iprodione, benomyl, copper hydroxide, and mancozeb) decreased primarily because disease pressure was low. The dry 2001 spring led to reduced powdery mildew pressure. Fungicide use may have also decreased because of greater use of a computer model for predicting powdery mildew development, allowing growers to reduce the number of applications. In contrast, lime sulfur use increased by 50,885 pounds (from 83,666 to 134,555). Lime sulfur, which had been widely used about 10 years ago, costs less and may have replaced some of these fungicides. Potassium bicarbonate became available to use in 1998. Since that time, its use has generally increased possibly because it is acceptable for organic production, and organic acreage has increased. Tebuconazole is a very popular new fungicide product that we would expect growers to use more in the future as reports of its success circulate.

Use of the fumigant methyl bromide decreased, in part because the federally-mandated phaseout has decreased supply and increased cost. In addition, DPR restrictions, including buffer zones and acreage restrictions, have also impacted use. Use of fenamiphos also decreased. Fenamiphos is a nematicide that is used to treat acreage before it is planted. Since fewer acres were planted to new vineyards, the need to treat acreage before it was planted has decreased.

Overall, the use of insecticides decreased from 2000 to 2001, since leafhopper and mite pressure was low, in general. Cryolite use decreased by 115,063 pounds from 2000 to 2001 (from 272,053 to 156,900 pounds, a 42% decrease). It is being replaced by new alternatives like imidacloprid which increased from 5,751 to 6,632 pounds and from 119,390 to 146,492 acres treated. Also, some wineries ask their growers not to use cryolite because it can be detected in the wines. Methomyl use decreased, although growers will use it late in the season when they are concerned about mealybugs. However, growers try to avoid using methomyl due to worker illness concerns. Although the use of potash soap rose from 8,010 pounds in 2000 to 11,345 pounds in 2001, that use is still more than 50% less than in previous years (1993-1999).

The warm, dry growing season of 2001 delayed weed germination, thus decreasing the need for herbicide applications. Among herbicides, the largest decrease in use was for oryzalin. (A factory explosion significantly reduced the availability of oryzalin statewide.)

**Table grapes and raisins:** Total pounds of AI on raisins and table grapes decreased by 7.2 million pounds from 2000 to 2001 (from 26.8 million pounds to 19.6 million pounds, a 27% decrease). The acres treated decreased by 2.7 million acres (9.5 million to 6.8 million acres, an 28% decrease). Raisin grape acreage showed a small decrease of 4,000 acres from 2000 to 2001 (from 287,000 acres to 283,000 acres, a 1.4% decrease), and table grape acreage decreased 2,000

acres from 2000 to 2001 (from 100,000 acres to 98,000 acres, a 2.0% decrease) (CASS 2002b). For raisins, the price decreased from \$125 per ton in 2000 to \$86 per ton in 2001; for table grapes, the price decreased from \$118 per ton in 2000 to \$87 per ton in 2001 (CASS 2002c).

Total pounds of fungicide used (sulfur, myclobutanil, iprodione, benomyl, copper hydroxide, copper oxychloride sulfate, mancozeb, copper, ziram, and benomyl) continued to decrease from 2000 to 2001. Because 2000 and 2001 were low on disease pressure, use of these fungicides decreased. Unlike the trend in wine grapes, tebuconazole (a new active ingredient) and potassium bicarbonate use in table grapes and raisins decreased from 2000 to 2001 probably due to lower crop prices for the raisin and table grape growers. Since it was less expensive, use of lime sulfur increased from 2000 to 2001 (a 15% increase).

Like the trend in wine grapes, use of fumigants (methyl bromide, 1,3-dichloropropene, and sodium tetrathiocarbonate) decreased, in part due to growers not planting new acreage.

Overall, use of insecticides decreased. Cryolite use decreased by 565,141 pounds (a 37% decrease); use of dimethoate also decreased. These AIs are being replaced by kaolin (a new active ingredient) and imadicloprid to control glassy-winged sharpshooter and other pests. Experimental results from pyridaben show that it provides good mite control and is used instead of propargite for safety reasons and because mites have not developed resistance as they have to other miticides. Propargite use decreased 54%.

Herbicide use in general decreased because 2001 was a warm, dry year, which delayed weed germination. Growers used less herbicide by narrowing the width of the sprayed row and using new spray technology to reduce the rate of application. Also growers probably replaced some herbicide applications with more cultivation. Growers selected a particular herbicide based largely on cost which may explain why use of trifluralin (a less expensive material) increased.

### **Almonds**

Total pounds of AI used on almonds decreased by 1.5 million pounds (13%), from 11.6 million pounds in 2000 to 10.1 million pounds in 2001, and acres treated decreased by 2.2 million acres (7.3 million to 5.1 million acres, a 30% decrease). California almond acreage was unchanged from 2000 to 2001 (595,000 acres) (CASS 2002d), though the percentage of non-bearing acreage decreased from 16% to 13%. This decrease indicates fewer new plantings in recent years, which may have affected herbicide and fumigant use. Kern, Merced, Stanislaus and Fresno counties remain the largest almond producing counties.

The decrease in commodity prices was the biggest contributor to less pesticide use. Almond prices decreased over the two-year period from \$0.97 per pound in 2000 to \$0.90 per pound in 2001 (NASS 2002a). In addition, the California almond industry is involved in a long-term program to reduce pesticide use by demonstrating effective alternative pest management practices to growers and pest control advisors.

Methyl bromide use decreased by 67%, from 171,825 pounds in 2000 to 56,888 pounds in 2001. Chloropicrin and metam-sodium use increased from 2000 to 2001. They continue to replace methyl bromide as fumigants for new plantings. Diazinon and chlorpyrifos use continued to decrease as growers find alternatives for control of peach twig borer. Fungicide use, particularly in the San Joaquin Valley, decreased due to dry weather conditions during and after bloom. Most pre-emergence herbicides (simazine, oxyfluorfen, norflurazon, and oryzalin) decreased as

growers try to reduce costs. Oryzalin was not available to growers during most of 2000 and all of 2001 due to factory shutdown, which explains the dramatic decrease of oryzalin use. The year 2001 was somewhat dry and did not require as many post-emergence sprays with a combination of glyphosate and oxyfluorfen.

### **Cotton**

Total pounds of AI on cotton decreased by 1.2 million pounds from 2000 to 2001 (from 9.3 million to 8.1 million pounds, a 13% decrease), and acres treated decreased by 2.2 million acres (12.2 million to 10.0 million acres, an 18% decrease). Use of all pesticide types (insecticides, herbicides, fungicides, and defoliant) decreased with the largest decrease occurring in herbicides. Insecticide use decreased from 1.8 million to 1.5 million pounds (18%); defoliant use decreased from 4.4 million to 4.1 million pounds (7%); herbicide use decreased from 1.6 million to 1.1 million (30%); and fungicide use decreased from 82,000 to 58,000 pounds (29%). Of the major pesticide uses reported, the only increases were in glyphosate, naled, endosulfan, cyfluthrin, imidacloprid, carbofuran, endothall, diuron, and thidiazuron.

Cotton acres planted decreased from 920,000 acres to 870,000 acres, a 5% decrease (CASS 2002a), so the decrease in acres planted cannot explain most of the decrease in pesticide use. Lower cotton prices may explain some of the reduced pesticide use. In 2000, market year average prices for Pima cotton were \$1.01 per pound, down to \$0.94 per pound in 2001. The same trend occurred for upland cotton (\$0.52 per pound in 2000 to \$0.435 in 2001) (NASS 2002).

Insecticide use in general decreased because of lower pest populations, especially lygus bugs and mites. Aphids and whitefly populations were higher late in the season but were probably not treated more than usual. Use of most defoliant decreased from 2000 to 2001. The only exceptions were diuron and thidiazuron, which are used at lower rates. Defoliant use varies from year-to-year depending on weather conditions before harvest which has a large effect on cotton defoliation. Different chemicals work better in different conditions. Also, there has been a relative increase in Pima cotton acreage which requires somewhat different defoliant.

Herbicide use, except for glyphosate, decreased probably because of increased plantings of glyphosate-resistant cotton. Traditionally, growers use pre-plant herbicides. However, glyphosate-resistant cotton allows glyphosate treatment during the growing season. Cyanazine is used mostly in cotton in California. Its use peaked in cotton at 577,000 pounds in 1995. Since 1995, its use has dropped dramatically each year. From 2000 to 2001 its use decreased by 25,000 pounds (from 40,000 pounds in 2000 to 15,000 pounds in 2001, a 63% decrease). The U.S. Environmental Protection Agency (EPA) has identified cyanazine as a major ground water contaminant. Under a voluntary agreement reached several years ago between the U.S. EPA and Du Pont Agricultural Products, use of cyanazine is being phased-out; use of existing stocks is to cease by December 31, 2002.

### **Strawberry**

Total pounds of AI on strawberries increased by 0.15 million pounds from 2000 to 2001 (from 7.74 million to 7.89 million pounds, a 2% increase). Acres treated decreased by 0.15 million acres from 2000 to 2001 (1.03 million to 0.88 million acres, a 15% decrease). In 2000, the total acreage planted to strawberries was 26,339. Of that total, 25,022 acres were fumigated and 1,317 acres were not treated with fumigants (California Strawberry Commission). In 2001, total acreage planted to strawberries decreased to 25,143 acres. Of that acreage, 23,886 acres were

fumigated and 1,257 acres were not fumigated. In 2000, the market year average price of strawberries was \$61.40 per hundredweight (Cwt; 1 Cwt = 100 pounds); in 2001 it increased to \$70.60 per Cwt (NASS 2002b)<sup>1</sup>.

Strawberry production relies on several pesticides (such as the fumigants methyl bromide, chloropicrin, 1,3-D, and metam-sodium) that are generally used at high rates. Fumigants are applied at high rates, in part, because they usually are used to treat a volume of space rather than a surface area such as the leaves and stems of plants. Thus, the pounds applied is large even though the number of applications or number of acres treated may be relatively small. Fumigants accounted for about 89% of all pesticide active ingredients by pounds applied in strawberries. Methyl bromide use decreased by 457,355 pounds from 2000 to 2001 (from 4.2 million to 3.8 million pounds, an 11% decrease). This decrease in methyl bromide use is likely due to an increase in its cost and expanded restrictions that DPR placed on field applications. Methyl bromide was replaced by other fumigants (chloropicrin, 1,3-D, and metam-sodium) whose use increased by 806,000 pounds.

The use of the major fungicides (sulfur, captan, thiram, iprodione, and myclobutanil), decreased from 2000 to 2001 by 158,000 pounds, likely due to the dry weather in 2001. The dry weather likely resulted in less disease pressure. Growers use the fungicide fosetyl-al to control soil borne diseases. Its use also decreased by 1,201 pounds from 2000 to 2001; however, no clear explanation appears to exist for this decrease.

### **Tomato (Processing)**

Total pounds of AI on processing tomatoes in 2001 decreased by almost 3 million pounds (from 10.7 million pounds in 2000 to 7.7 million pounds in 2001, a 28% decrease). Treated acreage was down 516,000 acres (from 2.4 million to 1.9 million acres, a 21% decrease). Tomato acreage decreased by 31,000 acres (from 289,000 acres in 2000 to 258,000 acres in 2001, an 11% decrease) (CASS 2002a).

A major factor in the reduction of pesticides used was the reduction in acres planted. Also, growers in the Sacramento Valley and Northern San Joaquin Valley (San Joaquin County) used almost 70% transplants as opposed to direct seed in 2001. Because transplants go in later, at the lay-by stage, there would probably be a reduction in the use of pre-emergent herbicides, as well as a reduction in some insecticides and fungicides that would be used only at the early seedling stage.

Another factor is the shift in planted acres from the Sacramento and Northern San Joaquin Valleys to the Southern San Joaquin Valley. Pesticide use is reportedly lower due to reduced insect pressure (earlier harvest) and reduced disease pressure (lower rainfall and hot spring conditions in 2001 with 9 days in May over 100 degrees in Fresno County).

In addition, the price for processing tomatoes was down forcing growers to reduce input costs. This low price may help to explain the decreased use of glyphosate, which is used to control

---

<sup>1</sup> The California Strawberry Commission provided the following information about prices that growers received for strawberries in 2000 and 2001. In 2000, the yearly weighted average price for fresh market strawberries was \$5.59 per crate (1 crate = 11.5 pounds) and \$3.89 per crate (1 crate = 18 pounds) for processed strawberries. In 2001, the yearly weighted average price increased to \$7.00 per crate for fresh market and to \$5.20 per crate for processed strawberries.

weeds on ditch banks and other non-crop areas; glyphosate use was down 57% in 2001 as compared to 2000.

### **Rice**

Total pounds of AI on rice decreased by 1.2 million pounds from 2000 to 2001 (from 7.1 million to 5.9 million pounds, a 16% decrease). Total acres treated with pesticides decreased by 0.4 million acres from 2000 to 2001 (from 2.3 million to 1.9 million acres, a 19% decrease). Total acres of rice planted decreased by 77,000 acres from 2000 to 2001 (from 550,000 to 473,000 acres, a 14% decrease) (CASS 2002a). The market average price for rice decreased from (\$4.99 per Cwt) in 2000 to (\$3.60) per Cwt in 2001 (NASS 2002b).

AIs used for weed control accounted for the largest portion of the decrease in total pounds of AIs used. Molinate, thiobencarb, and triclopyr accounted for 57% (681,299 pounds) of the 1.2 million pound decrease in total pounds of AIs used. The lower rice acreage explains the decrease in most pesticides. Other reasons for the decreased use of molinate and thiobencarb include increased weed resistance and the availability of the new herbicide cyhalofop-butyl. In addition, delayed phytotoxic syndrome (herbicide breakdown product becomes phytotoxic to rice) in certain areas contributed to reduced use of thiobencarb.

Although propanil use increased slightly (24,269 pounds, an 18% increase) from 2000 to 2001, this increase is substantial given the reduced rice acreage in 2001. Factors contributing to increased propanil use include: its increased use in place of molinate and thiobencarb (due to resistance issues), and its increased use in place of bensulfuron for control of sedges and broadleaf weeds resistant to bensulfuron.

Carbofuran was not used in 2001 since its registration was cancelled. Combined use of lambda cyhalothrin and diflubenzuron replaced carbofuran for rice water weevil control. The decrease in use of both lambda cyhalothrin and diflubenzuron is largely due to the combined use of these materials (for rice water weevil) that reduces the rates of each. The decrease in rice acreage also accounts for their decreased use. Carbaryl use for armyworm control has been largely replaced by the more effective lambda cyhalothrin. From 2000 to 2001, pounds of copper sulfate, used to control algae and tadpole shrimp, decreased by 503,205 pounds (from 3.2 million to 2.7 million pounds, a 16% decrease). It was used more in 2000 to control a large algae problem that decreased in 2001. The reduced rice acreage also accounts for its decreased use.

### **Peaches/Nectarines**

Total pounds of AI on peaches and nectarines decreased by about 780,000 pounds, and acres treated decreased by 980,000 acres from 2000 to 2001. Considering the nine years (1993-2001) for which data were compared, 2001 ranked the second lowest, while 2000 ranked the third highest. Total pounds of AI used appear to remain relatively constant since 1993. Growers received \$0.219 per pound for peaches in August 2000 compared to \$0.216 per pound in August 2001 (NASS 2002b).

The largest decreases (in pounds of AI) were in “petroleum oil, unclassified,” copper hydroxide, copper sulfate, methyl bromide, “petroleum distillates, refined,” and chlorpyrifos. The largest increases were in phosmet, mineral oils, 1,3-D, petroleum distillates, and propargite.

“Petroleum oil, unclassified” is mostly used during the dormant season. We are not sure why its use decreased in 2001. One reason may be weather since these applications are highly subject to

weather factors. If it is dry early in the dormant season, growers use less for fear of phytotoxicity, while exceptionally wet seasons may make fields too muddy for access. Copper-based fungicides decreased significantly in 2001. These are usually applied prophylactically with dormant oils for peach leaf curl and brown rot. Whatever caused growers to reduce dormant oil application might have also reduced copper use. Growers have continued the trend of using 1,3-D instead of methyl bromide to kill soil pests during replanting operations.

Pest control applicators (PCAs) report that most growers are using phosmet as an in-season insecticide in place of other, more toxic chemicals, such as methomyl. Above-average infestations of mites occurred in 2001, which could account for increases in both propargite and mineral oils. Use of certain high-toxicity OPs and carbamates such as methomyl, azinphos-methyl, methidathion, and diazinon continued to decrease. Chlorpyrifos use also decreased for the first time since 1995, possibly also related to the decrease in dormant spray use. Many growers now add esfenvalerate to their dormant oil sprays, either alone or with organophosphates, for better control of peach twig borer (PTB). The convenience and low price of this strategy may account for the decline in Bt use since its peak in 1998. Bt is an effective reduced-risk material primarily used for PTB control; however, multiple applications are generally required.

### **Lettuce**

**Head (iceberg) lettuce:** Total pounds of AI on head lettuce decreased by 0.4 million pounds from 2000 to 2001 (from 1.8 million to 1.4 million pounds, a 19% decrease), but acres treated increased by 0.1 million acres (from 2.7 million to 2.8 million acres, a 4% increase). Head lettuce acres increased from 130,000 acres in 2000 to 137,000 acres in 2001 (a 5% increase) (CASS 2002a). In 2000, market year average price for head lettuce was \$18.8 Cwt; in 2001, it was \$18.1 Cwt (NASS 2002b).

The greatest decreases in pounds were due to a reduction in use of the soil fumigants methyl bromide, metam-sodium, and chloropicrin, which together decreased by 0.2 million pounds (from 526,000 to 307,000, a 42% decrease). However, these materials are generally used at high rates. Although they accounted for 21% of all pounds applied to head lettuce in 2001, they accounted for only 0.06% by acres treated.

By acres, the greatest decrease was with the insecticide methomyl. Methomyl is used for beet armyworm and other caterpillars, and these pests were more of a problem in 2000. Also, in 2001 growers rotated in some of the newer reduced-risk materials such as spinosad. However, use of the insecticide diazinon rose, but this is the only effective material for soil pests, and the increase was possibly due to more extensive acreage in 2001 than in 2000.

Use of herbicides increased slightly, again possibly due to increased acreage. In the Imperial Valley, use of the pre-emergent herbicide bensulide was up, possibly due to earlier plantings of lettuce. Use of fungicides increased somewhat, possibly due to cooler-than-usual spring weather in the San Joaquin and Salinas Valleys.

**Leaf lettuce:** Total pounds of AI on leaf lettuce decreased by 100,000 pounds from 2000 to 2001 (from 887,000 to 787,000 pounds, an 11% decrease), but acres treated increased by 67,000 (from 1.34 million to 1.41 million acres, 5% increase). Leaf lettuce acreage increased from 81,000 to 91,000 (a 12% increase) (CASS 2002a). In 2000, the market year average price was \$29.6 per Cwt, and in 2001 it was \$24.8 per Cwt (NASS 2002b).

The pest management problems and practices associated with the cultivation of both head (iceberg) and leaf lettuce varieties are nearly the same, and many of the same trends were seen for both crops. As with head lettuce, a reduction in use of the soil fumigants (methyl bromide, metam-sodium, and chloropicrin) accounted for a large proportion of the decrease in pounds from 2000 to 2001, decreasing by 104,000 pounds (from 293,000 to 189,000, a 35% decrease). However, although these fumigants accounted for 24% of the total pounds applied in leaf lettuce in 2001, they accounted for only 0.08% of the acres treated.

Use of insecticides generally increased from 2000 to 2001, except for methomyl and dimethoate. Methomyl is used for beet armyworm and other caterpillars that were plentiful in 2000. Also in 2001, growers continued to use some of the newer reduced-risk materials such as spinosad and imidacloprid. Increases in the use of other insecticides may have been due to increased acreage in 2001.

Use of herbicides increased from 2000 to 2001, mainly due to increased use of the pre-emergent herbicide bensulide, which is mostly used in desert areas such as the Imperial Valley. In this area, more early than late leaf lettuce was planted during 2001, and more bensulide is needed for earlier plantings. Use of fungicides rose somewhat, possibly due to cooler-than-usual spring weather in the San Joaquin and Salinas Valleys.

## **VI. Summary of Pesticide Use Report Data 2001 Indexed by Chemical**

The following report presents information of statewide pesticide use for 2001. For each chemical, the commodity on which it was used, total pounds applied, the number of agricultural applications made, and the amount of commodity treated are summarized.

A summary by commodity is presented in a separate report, *Summary of Pesticide Use Report Data 2001 Indexed by Commodity*. Both versions of the Pesticide Use Report can be purchased from DPR or downloaded from the DPR website at [www.cdpr.ca.gov](http://www.cdpr.ca.gov).
